

Matched counterevidence drives numerical convergence but not structural-law recovery

15/15 low post-evidence error

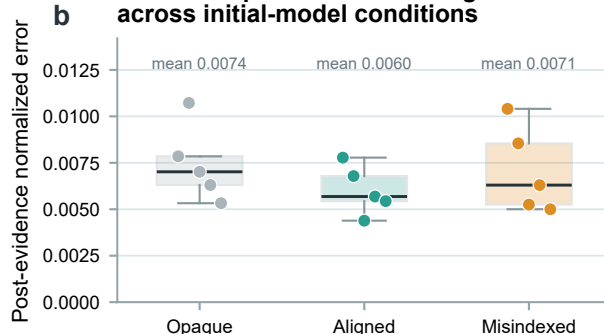

0/5 exact 1.75-law recovery

● Opaque ● Aligned ● Misindexed

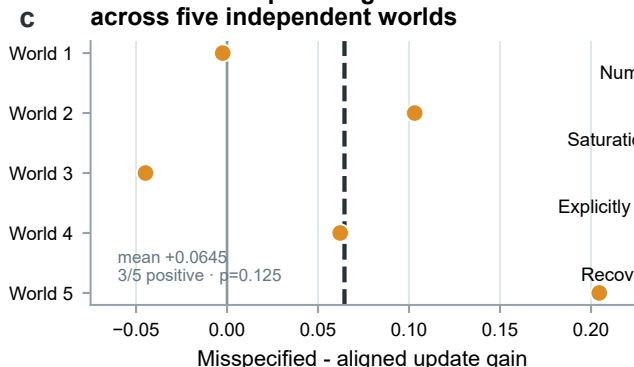

a Identical phase-process evidence drives all arms toward accurate predictions

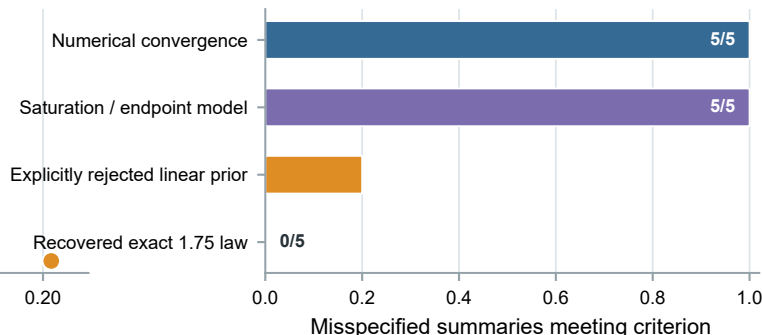

b Numerical predictions converge across initial-model conditions

c The selective-update signal is mixed across five independent worlds

d Numerical revision stops short of structural-law identification

Corrected structural matched-evidence study: 5 worlds $\times$ 3 initial-model arms. All arms received the same direct phase-process evidence; the five-world contrast is descriptive and non-confirmatory. Parametric matched evidence separately yielded 5/5 wrong-direction rejections and 5/5 peak-and-collapse summaries.
