a Normalized pH
reagent command
component command
Normalized pH
Nominal final loading (mol/L)
b Dissociation fraction
Dissociation fraction
Nominal final loading (mol/L)
c Precipitation signal
Precipitation signal
Nominal final loading (mol/L)
d One explanation history, including its unresolved end
Before research
Weak-acid expectation: higher loading lowers pH and dissociation.
After 6 assays
Component 0 may set loading. A concentration response supports; flatness favours background or weak coupling.
After 12 assays
Plateau retained; fixed background, saturation and weak trends unresolved.
Later prediction
Fixed background favoured as experimentally supported; dilute regime untested.
Both feed commands add the same species: no acid-identity contrast.
Broader dilution was proposed in the terminal note but not executed.
e New use of local evidence
Withheld mean
No research
