

Provider-separated execution audit for the frozen baseline development runs

WellAU/Codex — complete development matrix

Coverage

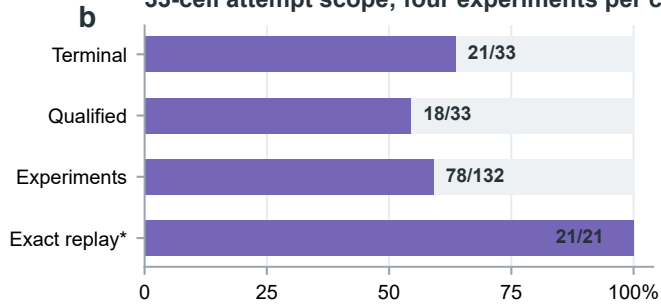

45 scheduled cells; four experiments per cell

DeepSeek — pre-amendment attempts; harness audit only

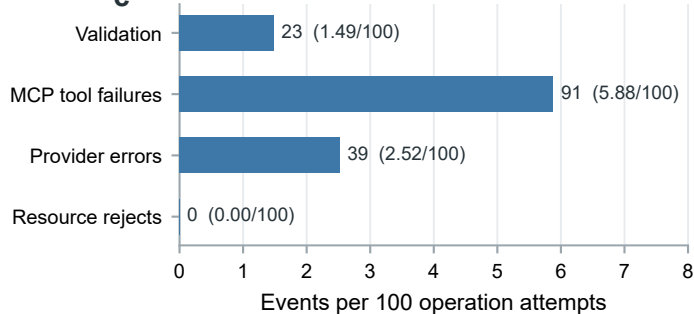

Coverage

33-cell attempt scope; four experiments per cell

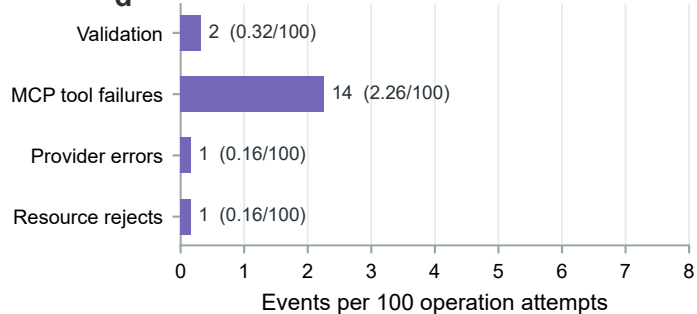

Technical event rates n=1,547 operation attempts

c

Technical event rates n=620 operation attempts

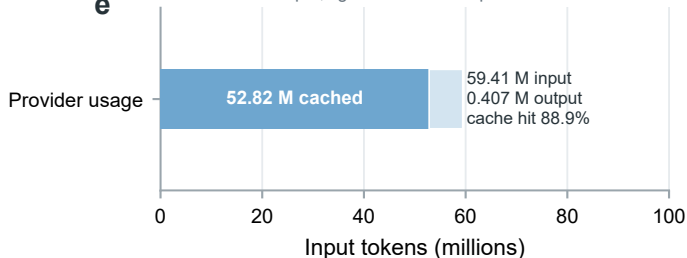

d

Token accounting

Dark = cached input, light = uncached input

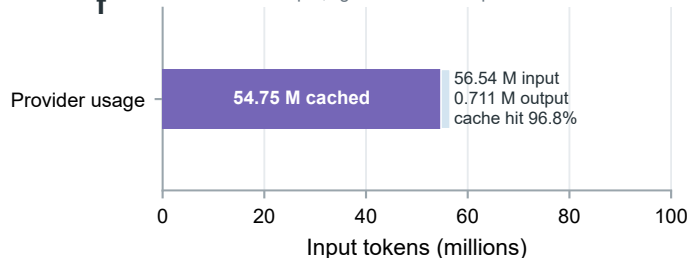

e

Token accounting

Dark = cached input, light = uncached input

f

Exact denominators are printed on every completion bar. *DeepSeek replay is 21/21 among terminal retained records, not 21/33 scheduled cells. Operational rates are receipt-normalized and descriptive: provider, task coverage, harness version and recovery policy differ. Cached tokens are cached input, not repeated model output; providers are not pooled into a scientific contrast. Later recovery-amended seed-0 pilots are excluded from this frozen baseline.
