

The entity-level confirmatory core preserves the world-level denominator

a Five heterogeneous task families define the entity-level core

b Study A: one world cluster

c Evidence partitions

No evaluator feedback enters the participant session

d Core denominators

- 25** Independent clusters
 - 75** Participant cells
 - 300** Complete experiments
 - 100** Held-out truth runs
 - 450** Blind executions
- Operations, checkpoints and repeats remain nested—not extra samples

Study A contains 25 independent task × world clusters; non-entity extensions and artifact transfer retain separate protocols and denominators.
