

Explicit priors shift endpoints, but misindexed information is not reliably rejected

Warnings track dossier presence, not misindexing

Aligned cells are flagged as often as misindexed cells

Recovery-amended development matrix

43/45 cells; 174/180 experiments; 45/45 replay

World seed

Development data only: DeepSeek V4 Flash with the recovery-amended Codex harness, five world seeds per task, descriptive summaries, no formal tests. Two crystallization contract failures are retained. No evaluator-truth prediction scoring or blind replay is available; endpoint and self-report summaries do not establish law discovery, wrong-prior rejection or transfer.
