

Better executable laws still do not produce better actions

Matched 135-cell C2 cohorts: law MAE 0.237 → 0.175; blind gain -0.0010 → -0.0001

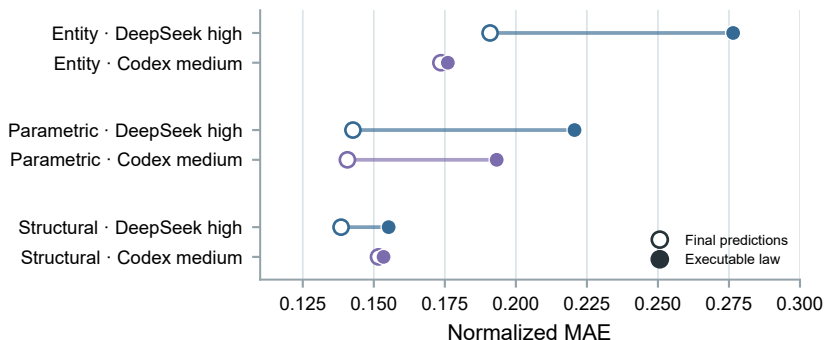

a Both complete cohorts fail the selective-correction gate

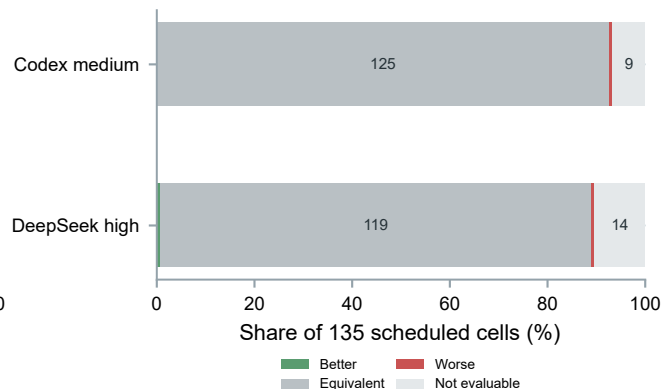

b General numerical learning occurs in every locus and model

c Codex compresses more faithfully, but the representation gap persists

d Better law compression produces no blind-action advantage

DeepSeek and Codex use the same 45 task-world clusters, nine tasks and three prior arms. Panels a-b retain the registered failure-aware correction decisions; panel c is matched descriptive and separates final explicit predictions from submitted executable laws. Panel d keeps every scheduled cell: DeepSeek better/equivalent/worse/not-evaluable is 1/119/1/14 and Codex is 0/125/1/9. Model differences are not provider causal effects or a leaderboard.
