

A One world, two independent execution units

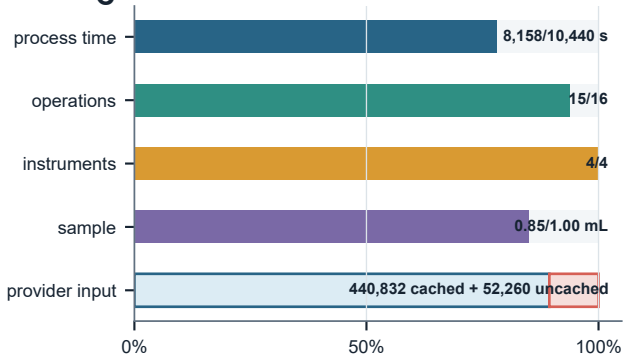

The deterministic path qualifies the world; it does not replace the complete-agent unit.

B The complete-agent lifecycle closes

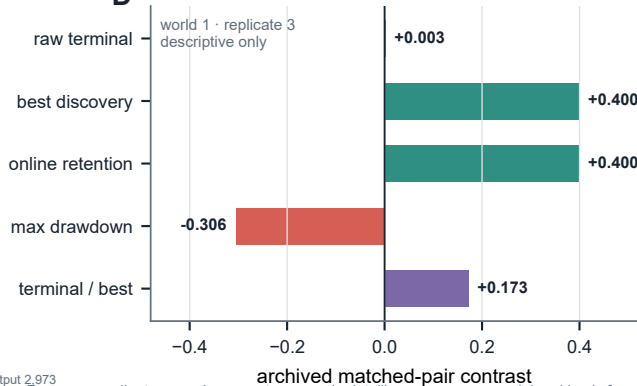

C Environment and provider use separate ledgers

provider input row = context composition, not a limit · 1 session · 1 logical turn · 17 calls · output 2.973

D A near endpoint can hide a different process

Process coordinates remain separate; no scalar intelligence score or model ranking is formed.
