

Explicit priors reshape exploratory behavior, but warnings are not selective

● Aligned - opaque ● Misindexed - opaque ◆ Descriptive mean

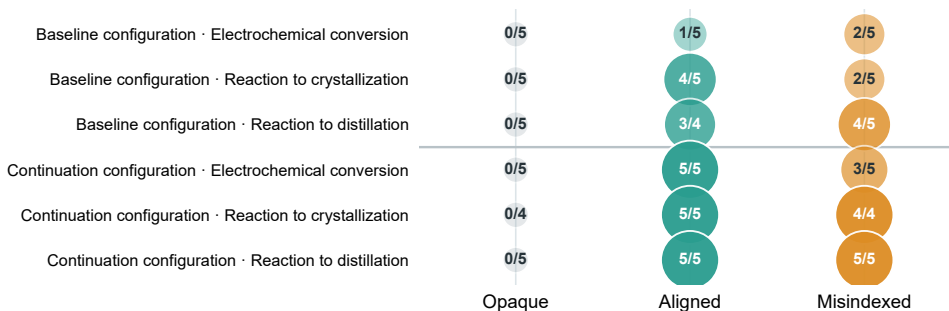

a Baseline exploratory configuration
Rows are task-world pairs; diamonds are means

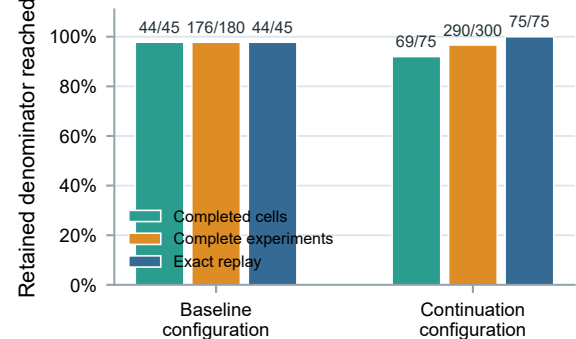

b Continuation exploratory configuration
Rows are task-world pairs; diamonds are means

c Final misindex warnings
Labels are flagged cells / available cells

d Execution completeness
Failures remain in the denominator

Exploratory descriptive evidence. Each row is one task-world pair; a short within-row segment links the two contrasts and diamonds show task means. No confirmatory tests or cross-system capability comparison are performed. The two configurations use separate method and interface contracts. Endpoint gains and verbal warnings do not establish law discovery, wrong-prior rejection or transfer.
