

B2 numerical-expression dissociation; B3 sparse structural recovery

B2: 45/45 post-packet summaries; family underidentified

B3: 5/60 joint recoveries; 0/36 scheduled useful gains

● Opaque ● Aligned ● Misindexed

Panels a-b show DeepSeek-v4-flash-high B2 conditional post-packet results; panel c adds matched GPT-5.6-sol-medium and DeepSeek-v4-flash-low results. All configurations end with low post-packet error, while misindexed summaries express the exact 1.75 law in 0/5 worlds. The one-pair packet has an exact linear/power alias, so B2 does not test participant-level structural identification. Panel d reports the separate reference-fitter-identifiable B3 surface: DeepSeek has 13 retained schema failures, GPT recovers 5/30 joint laws, and neither model realizes a registered useful action gain (0/18 scheduled opportunities). Five-world and model comparisons are descriptive; no capability-ranking test is performed.
