

Lower executable-law error does not coincide with better blind action

C2 scheduled n=135/model; law n=135/129, MAE 0.237/0.175; blind n=121/126, gain -0.0010/-0.0001

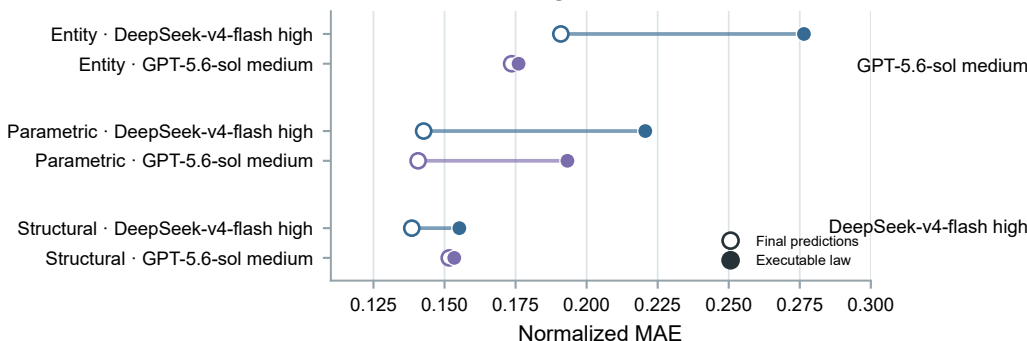

a Both fully scheduled surfaces fail the selective-correction gate

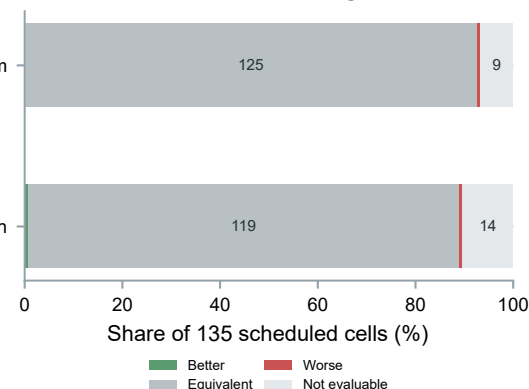

b General numerical learning occurs in every locus and model

c GPT-5.6-sol has lower compression error; the representation gap persists

d Lower observed law error coexists with near-zero blind-action gain

DeepSeek-v4-flash and GPT-5.6-sol use the same 45 task-world clusters, nine tasks and three prior arms. Panels a-b retain the registered adverse-bound correction decisions; panel c is availability-conditioned and descriptive. Panel d keeps every scheduled cell: DeepSeek better/equivalent/worse/not-evaluable is 1/119/1/14 and GPT is 0/125/1/9. Model differences are not provider causal effects or a leaderboard.
